

## Power

**Unit:** Energy, Work & Power

**NGSS Standards/MA Curriculum Frameworks (2016):** N/A

**AP Physics 1 Learning Objectives/Essential Knowledge (2024):** 3.5.A, 3.5.A.1, 3.5.A.2, 3.5.A.3, 3.5.A.4

**Mastery Objective(s):** (Students will be able to...)

- Calculate power as a rate of energy consumption.

**Success Criteria:**

- Variables are correctly identified and substituted correctly into the appropriate equations.
- Algebra is correct and rounding to appropriate number of significant figures is reasonable.

**Language Objectives:**

- Explain the difference between total energy and power.

**Tier 2 Vocabulary:** power

### Notes:

power: a measure of the rate at which energy is applied or work is done. The average power is calculated by dividing work (or energy) by time.

$$P_{avg} = \frac{\Delta E}{t} = \frac{W}{t} = \frac{\Delta K + \Delta U}{t}$$

Power is a scalar quantity and is measured in Watts (W).

$$1 \text{ W} = 1 \frac{\text{J}}{\text{s}} = 1 \frac{\text{N}\cdot\text{m}}{\text{s}} = 1 \frac{\text{kg}\cdot\text{m}^2}{\text{s}^3}$$

Note that utility companies measure energy in kilowatt-hours. This is because

$$P = \frac{W}{t}, \text{ which means energy} = W = Pt.$$

Because 1 kW = 1000 W and 1 h = 3600 s, this means

$$1 \text{ kWh} = (1000 \text{ W})(3600 \text{ s}) = 3\,600\,000 \text{ J}$$

$$\text{Because } W = F_{\parallel}d, \text{ this means } P_{avg} = \frac{F_{\parallel}d}{t} = F_{\parallel} \left( \frac{d}{t} \right) = F_{\parallel}v_{avg}$$

However, if we use the instantaneous velocity instead of the average velocity, this equation gives us the instantaneous power:

$$P_{inst} = F_{\parallel}v = Fv \cos \theta$$

AP<sup>®</sup>

## Power in Rotational Systems

In a rotational system, the formula for power looks similar to the equation for power in linear systems, with force replaced by torque and linear velocity replaced by angular velocity:

$$P = Fv$$

linear

$$P = \tau\omega$$

rotational

## Solving Power Problems

Many power problems require you to calculate the amount of work done or the change in energy, which you should recall is:

$$W = F_{\parallel} d$$

if the force is caused by linear displacement

$$\begin{aligned} \Delta K_t &= \frac{1}{2}mv^2 - \frac{1}{2}mv_o^2 * \\ &= \frac{1}{2}m(v^2 - v_o^2) \end{aligned}$$

if the change in energy was caused by a change in velocity

$$\begin{aligned} \Delta U_g &= mgh - mgh_o \\ &= mg\Delta h \end{aligned}$$

if the change in energy was caused by a change in height

## Solving Rotational Power Problems

AP<sup>®</sup>

Power is also applicable to rotating systems:

$$W = \tau \Delta\theta$$

if the work is produced by a torque

$$\begin{aligned} \Delta K_r &= \frac{1}{2}I\omega^2 - \frac{1}{2}I\omega_o^2 \\ &= \frac{1}{2}I(\omega^2 - \omega_o^2) \end{aligned}$$

if the change in energy was caused by a change in angular velocity

Once you have the work or energy, you can plug it in for either  $W$ ,  $\Delta K$  or  $\Delta U$ , use the appropriate parts of the formula:

$$P = \frac{W}{t} = \frac{\Delta K + \Delta U}{t} = Fv = \tau\omega$$

and solve for the missing variable.

\*  $K_t$  is translational kinetic energy. This is the only form of kinetic energy used in CP1 and honors physics. The subscript  $t$  is used here to distinguish translational kinetic energy from rotational kinetic energy ( $K_r$ ), because both are used in AP<sup>®</sup> Physics.

**Sample Problems:**

Q: What is the power output of an engine that pulls with a force of 500. N over a distance of 100. m in 25 s?

A:  $W = Fd = (500)(100) = 50000 \text{ J}$

$$P = \frac{W}{t} = \frac{50000}{25} = 2000 \text{ W}$$

Q: A 60. W incandescent light bulb is powered by a generator that is powered by a falling 1.0 kg mass on a rope. Assuming the generator is 100 % efficient (*i.e.*, no energy is lost when the generator converts its motion to electricity), how far must the mass fall in order to power the bulb at full brightness for 1.0 minute?

A:  $P = \frac{\Delta U_g}{t} = \frac{mg \Delta h}{t}$

$$60 = \frac{(1)(10) \Delta h}{60}$$

$$3600 = 10 \Delta h$$

$$\Delta h = \frac{3600}{10} = 360 \text{ m}$$

Note that 360 m is approximately the height of the Empire State Building. This is why changing from incandescent light bulbs to more efficient compact fluorescent or LED bulbs can make a significant difference in energy consumption!

**Homework Problems**

1. **(S)** A small snowmobile has a 9 000 W (12 hp) engine. It takes a force of 300. N to move a sled load of wood along a pond. How much time will it take to tow the wood across the pond if the distance is measured to be 850 m?

Answer: 28.3 s

2. **(M)** A winch, which is rated at 720 W, is used to pull an all-terrain vehicle (ATV) out of a mud bog for a distance of 2.3 m. If the average force applied by the winch is 1 500 N, how long will the job take?

Answer: 4.8 s

3. **(S)** What is your power output if you have a mass of 65 kg and you climb a 5.2 m vertical ladder in 10.4 s?

Answer: 325 W

4. **(M)** Jack and Jill went up the hill. (The hill was 23m high.) Jack was carrying a 21 kg pail of water.
- a. **(M)** Jack has a mass of 75 kg and he carried the pail up the hill in 45 s. How much power did he apply?

Answer: 490.7 W

- b. **(M)** Jill has a mass of 55 kg, and she carried the pail up the hill in 35 s. How much power did she apply?

Answer: 499.4 W

honors & AP<sup>®</sup>

5. **(M – honors & AP<sup>®</sup>; A – CP1)** The maximum power output of a particular crane is  $P$ . What is the fastest time,  $t$ , in which this crane could lift a crate with mass  $m$  to a height  $h$ ?  
*(If you are not sure how to do this problem, do #6 below and use the steps to guide your algebra.)*

$$\text{Answer: } t = \frac{mgh}{P}$$

6. **(S – honors & AP<sup>®</sup>; M – CP1)** The maximum power output of a particular crane is 12 kW. What is the fastest time in which this crane could lift a 3 500 kg crate to a height of 6.0 m?  
*(You must start with the equations in your Physics Reference Tables and show all of the steps of GUESS. You may only use the answer to question #5 above as a starting point if you have already solved that problem.)*  
*Hint: Remember to convert kilowatts to watts.*

Answer: 17.5 s

AP<sup>®</sup>

7. **(M – AP<sup>®</sup>; A – honors & CP1)** A 30 cm diameter solid cylindrical flywheel with a mass of 2 500 kg was accelerated from rest to an angular velocity of 1 800 RPM in 60 s.
- a. How much work was done on the flywheel?

Answer:  $5.0 \times 10^5 \text{ N}\cdot\text{m}$

- b. How much power was exerted?

Answer:  $8.3 \times 10^3 \text{ W}$
